

# AR-VAL REMOTE CONTROL

**YOUR DEDICATED EQUIPMENT'S  
MANAGEMENT SOLUTION**

Ar-Val Remote Control software makes it possible to optimize execution of maintenance operations.

Thanks to a wireless network, it is possible to move within the sorting plant without constraints, scan an equipment via a QR Code and take control of it.

*Example : Fast control taking  
via QR Code*

## FLEXIBILITY

Ar-Val Remote Control system is constituted of one server and of one or several clients (smartphones, tablets). Clients are connected to the wireless network and communicate with the server. The server manages the communication with the equipment and the system can include multiples functionalities such as:

- Remote control of an equipment via a tablet
- Fast control taking via QR Code
- Reduce number of maintenance operators required to one
- No wired connection, allowing for freedom of movement
- Capacity to use the system with one or several tablets simultaneously
- Visualisation of the engine's intensity and frequency if such a measurement is possible
- Visualisation of the operating time and number of startup.
